On the cover: Each fall, millions of monarch butterflies undergo a breathtaking migration from eastern North America to their overwintering grounds in central Mexico. In this issue, Zhan et al. (pp. 1171–1185) present the draft genome of the monarch butterfly that reveals a full set of protein-coding genes. The analysis provides insight into genes central to major aspects of the long-distance migration, including sun compass navigation, reproductive quiescence, and longevity. The cover photograph shows a clutch of overwintering migrants covering a tree trunk in Michoacan, Mexico. Photo credit: Thomas Marent, Minden Pictures (Getty Images).
